

Committed to the Environment and Community

PXGEO commits to leading the industry in minimizing impact on the environment and protecting the communities in which we work.

PXGEO's goal is to never spill or discharge anything that could cause harm to the environment. PXGEO complies with all relevant regulations and strives to reduce, reuse, or recycle wherever possible.

Through established procedures, PXGEO sets targets for minimizing waste and reducing emissions to ground, water and air. Measurement and monitoring the progress of our environmental stewardship is carried out continuously and our findings are reported in accordance with regulatory requirements and internal Company procedures.

PXGEO adopts the latest technologies and initiatives available in the geophysical and maritime industries to minimize our environmental footprint, including:

- Ultra-low sulphur fuels
- Ballast Water Management Systems (BWMS)
- Solid streamers
- Biodegradable hydraulic fluids on contracted ROVs and propriety subsea node handling systems
- Highly accurate positioning of ROV for precise subsea operations to ensure integrity of the surrounding environment
- An optimized seismic source array specifically designed to minimize noise impact to the surrounding environment.

The PXGEO seismic fleet carries the stringent DNV Clean-Design notation.

A handwritten signature in black ink, appearing to read 'D Eley'.
